MODBUS SETTINGS						
UNIT_ID	3x65222 4x65222 I:65221	65535,0xFFFF B:FF FF		N/A:NO CHANGE	UINT16 R/W	NO
UNIT ID:255						

If the host reads this register, the current programmed unit ID is returned. All values above unit ID 255 define also the unit ID 255.
 If the host writes a new value into this register, the new value will be stored in the FLASH as the new unit ID. The new unit ID is activated after a power off/power on cycle or a software reboot of the module.
 The host can execute a reboot in writing to the register RESET SYSTEM.

NOTE:DIP switch 4 must be set to OFF to activate this unit ID, otherwise the unit ID is 255.

HINT:This settings will be active after you repower or reset your device !!

BAUD_RATE	3x65223 4x65223 I:65222	4294967295,0xFFFFFFFF B:FF FF FF FF	38400	38400	UINT32 R/W	NO

This is the current configured baud rate for DIP switch mode DIP1=ON, DIP2=ON (default is 57600bd)

DIP switch settings:
 DIP1-DIP2
 OFF-OFF:9600bd
 ON-OFF:19200bd
 OFF-ON:38400bd
 ON-ON:default 57600bd or the defined baud rate

Valid baud rates are:

300bd
 600bd
 1200bd
 2400bd
 4800bd
 9600bd
 19200bd
 38400bd

		NO PARITY		SELECT PARITY		

If the register is read out, the currently set parity of the serial interface is returned.

Writing a value to this register will change the new parity in FLASH. This will only take effect after a restart of the module. This can be triggered by writing to the RESET SYSTEM register.

Parity values are

0: no parity
 1: even parity
 2: odd parity

STOP BITS	3x65226 4x65226 I:65225	65535,0xFFFF B:FF FF		N/A:NO CHANGE	UINT16 R/W	NO
		ONE STOPBIT		SELECT STOPBITS		

If the register is read out, the currently set number of stop bits of the serial interface is returned.

Writing a value to this register will change the new number of stop bits in the FLASH. This will only take effect after a restart of the module. This can be triggered by writing to the RESET SYSTEM register.

Values for stop bits are

1: one stop bit
 2: two stop bits

DALI DT8:STATUS REGISTER	3x01101 4x01101 I:1100	0,0x0000 B:00 00	0		UINT16 R/O	
Current value of register:0						
This register shows the actual status of the last triggered DT8 command. Wevery time you trigger a new DT8 command, internally many DALI commands are generated. Therefore you have to poll this registers to find out, if and how the last DT8 command was finished. The following values are returned: 0: No operation happened in the past 1: Last operation was successfully finished. The values in the registers are valid. 9999: Last operation was finished, but had errors (Timeout or no answer). 32768,0x8000: Last command is currently processed and is not finished yet.

		Current value of register:1				
This register shows the actual status of the last triggered DT8 command. Wevery time you trigger a new DT8 command, internally many DALI commands are generated. Therefore you have to poll this registers to find out, if and how the last DT8 command was finished. The following values are returned: 0: No operation happened in the past 1: Last operation was successfully finished. The values in the registers are valid. 9999: Last operation was finished, but had errors (Timeout or no answer). 32768,0x8000: Last command is currently processed and is not finished yet.

		Current value of register:1				
This register shows the actual status of the last triggered DT8 command. Wevery time you trigger a new DT8 command, internally many DALI commands are generated. Therefore you have to poll this registers to find out, if and how the last DT8 command was finished. The following values are returned: 0: No operation happened in the past 1: Last operation was successfully finished. The values in the registers are valid. 9999: Last operation was finished, but had errors (Timeout or no answer). 32768,0x8000: Last command is currently processed and is not finished yet.

	RX	N/A		
This command defines the DALI priority slot. There are 5 slots available: 0: 12ms: Highest priority, used for messages that must be repeated 1: 13ms: User initiated arc power control commands and commands which have an impact on manual adjustment of arc power (e.g., dim up with a special fade time) 2: 14ms: Configuration in general 3: 15ms: Automatic arc power control commands 4: 16ms: Lowest priority, used for query messages

	RX	#255,OK<CR>				

Sets for a lamp short address a new brightness level between 0 and 254. 255 means MASK. This command sets in addition for up to 6 channels the new level between 0 and 65534 for a DALI device type 8 lamp with RGBWAF colour feature. 65535 means MASK for channel level.

HINT: The amount of command arguments depends on how many channels are written!
